Bonding Review

Most elements react to form compounds. Elements do this to gain a full set of valence electrons (Octet Rule—"If I 8 I fall").

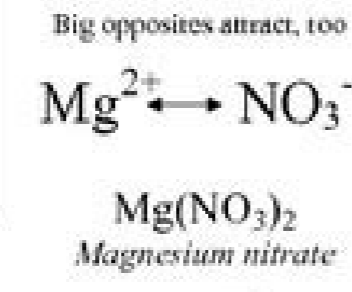

Ionic Compounds occur between metals and non-metals because metals become cations (positive ions) and non-metals become anions (negative ions). And opposites attract.

Covalent Compounds occur between non-metals. Because neither element will give up their electrons (too many protons), they share electrons to complete the full set of 8.

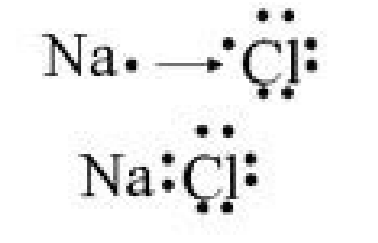

Polyatomic Compounds are compounds with 3 or more elements. These are just large ionic compounds. They happen because sometimes when two elements react they don't fulfill the octet rule and end up with a net electrical charge.

Ionic, Covalent, or Polyatomic?

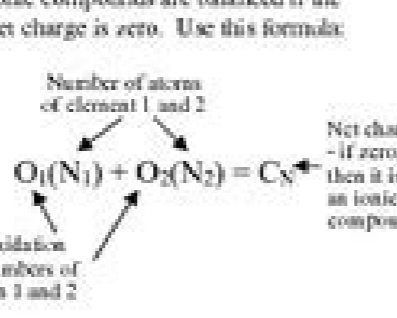

K ₂ O (Potassium oxide)	AlF ₃ (Aluminum fluoride)	Li ₂ CrO ₄ (Lithium chromate)	Ca ₃ N ₂ (Calcium nitride)
CO ₂ (Carbon dioxide)	MgCO ₃ (Magnesium carbonate)	SiCl ₄ (Silicon tetrachloride)	NaCl (Sodium chloride—table salt)

Use dot diagrams like puzzle pieces. For ionic compounds remember that the metal is actually *losing* the electrons to the non-metal.

Making Ionic Compounds

Or use the "cross the number not the sign" method.
 $Ca^{2+} \leftrightarrow Cl^{-}$
 This compound will be stable because the net charge is zero.
 $(2) + 2(-) = 2 - 2 = 0$

Make Balanced Ionic Compounds

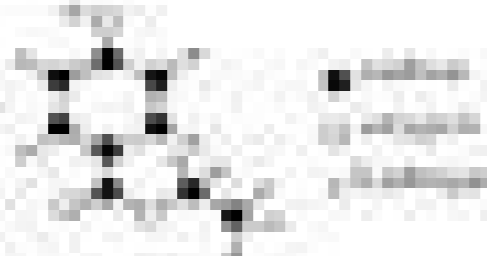

Li and N	Ca and O	Al and Cl	Na and Ne
----------	----------	-----------	-----------

Using the formula above show that Na₂O is balanced.

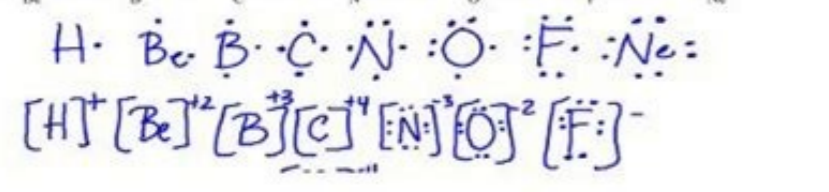

Review 20 Multiple choice questions

- Which element is most likely to form a cation? a. Li b. F c. O d. Cl
- Which element is most likely to form an anion? a. Li b. F c. O d. Cl
- Which element is most likely to form a covalent bond? a. Li b. F c. O d. Cl
- Which element is most likely to form a metallic bond? a. Li b. F c. O d. Cl
- Which element is most likely to form a network solid? a. Li b. F c. O d. Cl
- Which element is most likely to form a molecular solid? a. Li b. F c. O d. Cl
- Which element is most likely to form a giant ionic lattice? a. Li b. F c. O d. Cl
- Which element is most likely to form a giant covalent lattice? a. Li b. F c. O d. Cl

- Which element is most likely to form a cation? a. Li b. F c. O d. Cl
- Which element is most likely to form an anion? a. Li b. F c. O d. Cl
- Which element is most likely to form a covalent bond? a. Li b. F c. O d. Cl
- Which element is most likely to form a metallic bond? a. Li b. F c. O d. Cl
- Which element is most likely to form a network solid? a. Li b. F c. O d. Cl
- Which element is most likely to form a molecular solid? a. Li b. F c. O d. Cl
- Which element is most likely to form a giant ionic lattice? a. Li b. F c. O d. Cl
- Which element is most likely to form a giant covalent lattice? a. Li b. F c. O d. Cl

- What determines the chemical stability of an atom? The number of valence electrons in the outer energy level determines the chemical stability of an atom.
- What is a chemical bond? A chemical bond is the force that holds the atoms together in a compound.
- Why do atoms chemically bond to form compounds or molecules? Atoms chemically bond to form compounds or molecules to become stable.
- Why are atoms that bond less stable existing by themselves? Atoms that bond are less stable existing by themselves because they don't have eight valence electrons in their outer energy level.
- What is the octet rule? The octet rule states that atoms want to have 8 valence electrons in their outer energy level.
- Which electrons are involved in chemical bonding? Valence electrons in the outer energy level are involved in chemical bonding.
- Which group of elements is chemically stable and tends to not bond with other elements? Group 18, the noble gases are chemically stable and tend to not bond with other elements.
- Why do noble gases exist independently (not in compounds) in nature? The noble gases exist independently in nature and do not readily form compounds because they already have a full outer shell of valence electrons in their outer shell.
- Which noble gas is chemically stable, but has less than 8 valence electrons in its outer shell? Helium is chemically stable, but only has two valence electrons in its outer shell.
- Why is the element #9 chemically stable even though it has less than 8 valence electrons in its outer shell? Helium is chemically stable even though it doesn't have 8 valence electrons because it only has one energy level and it is full with two electrons and this makes it chemically stable.
- Why is Hydrogen an exception to the octet rule? Hydrogen is an exception to the octet rule because it only has one energy level and it wants to have two electrons to be like Helium, which is stable.
- Metals tend to _____ electrons and form _____ ions.
- Nonmetals tend to _____ electrons and form _____ ions.
- What type of elements form ionic bonds? A metallic bonding with a nonmetal forms an ionic bond.
- What is a polar covalent bond? The electrons are not equally shared in a polar covalent bond. One part of the molecule has more pull on the electrons than the other part of the molecule. In a polar covalent bond, you generally have 2 different elements bonding, ex: CCl₄.
- What does the unequal sharing of electrons cause in a polar covalent bond? The unequal sharing of electrons causes one end of the molecule to be slightly positive and the other end to be slightly negative.
- What type of bonding would be expected between the following atoms?
 a. H and F Polar covalent c. Li and Br Polar covalent
 b. Ca and S Ionic d. P and O Nonpolar covalent
- Draw an electron dot diagram that shows the correct bonding for the following atoms:
 a. Mg and Cl c. C and O
 b. Na and Cl d. H and O
- What is a single covalent bond? A single covalent bond is when two electrons are shared between molecules.
- What is a double covalent bond? A double covalent bond is when four electrons are shared between molecules.
- What is a triple covalent bond? A triple covalent bond is when six electrons are shared between molecules.
- What do electron-dot notations (dot-diagrams) show about an element? An electron dot diagram shows the number of valence electrons the atom has in its outer energy level.
- Write the electron dot diagram for the following atoms AND write the chemical symbol with the oxidation number:
 H Be B C N O F Ne
